

# Set Theory

Part 3

# What is a Set?

Organizing Information

## What is a Set?

- A *set* is an unordered collection of “objects”
- The collection objects are also called “members” or “elements”
- One of the most fundamental structures in mathematics

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 3

## Set Notation

- We typically denote a set name using capital letter
- Members are separated with commas and encapsulated within curly brackets

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 4

## Famous Sets (in Mathematics)

Letter	Name	Members
Z	Integers	..., -2, -1, 0, 1, 2, 3, ...
N	Natural Numbers	1, 2, 3, 4, ...
Q	Rational Numbers	$a/b$ where both $a$ and $b$ are integers and $b$ is not 0

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 5

## Famous Sets (in Mathematics)

Letter	Name	Members
R	Real Numbers	All non-imaginary numbers. e.g. 1, 2.5, 3.1415....
U	Universal Set	All values of potential interest (U depends on context)

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 6

## Set Notation: Membership

- Set notation uses a special symbol to denote if an object is a member of a set
- Below, the set  $V$  contains vegetables

`potato ∈ V`

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

7

## Set Notation: Membership

- This is read as "potato is an **element** of  $V$ "
- ...or "potato is a **member** of  $V$ "

`potato ∈ V`

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

8

## Set Notation: Not a Member

- There is another special symbol that denotes an object is **not** a member of a set
- In the example below, the set  $F$  contains fluffy animals

`lizard ∉ F`

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

9

## Defining Sets

How to specify items

## Defining Sets

- Sets can be defined a number of different ways
- Each competing notation has advantages & disadvantages – depending on what you are defining

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

11

## Set Notation: Explicit

- We can **explicitly** define this by listing each element
- For example, we can define a set  $S$  for members of the Three Stooges

`S = {moe, larry, curly, shemp}`

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

12

## Set Notation: Pattern

- We can also specify a set by using a *pattern*.
- In the example below we are define a set of integers between 0 and 9.

```
A = {0, 1, 2, ... 9}
```

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

13

## Empty Set

- An *empty set* contains no elements
- Can be represented with two curly-brackets (nothing in between)
- There is also a special symbol for empty sets

```
A = { }
A = ∅
```

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

14

## Set Builder Notation

- A set can also be defined using *set builder notation*
- Consists of a variable name, a pipe symbol, and an true/false expression

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

15

## By Characteristic

- The most basic form consists of a variable and an true/false statement
- In this example, everything that satisfies "x is an even integer" will be the set

```
{x | x is a even integer}
```

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

16

## By Characteristic Examples

Expression	Result
{ x   x is an integer }	{ ..., -1, 0, 1, 2, 3, ... }
{ x   x is an even integer }	{ ..., -2, 0, 2, 4, 6, ... }
{ x   x is odd natural number }	{ 1, 3, 5, 7, 9, ... }

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

17

## Characteristic with Restriction

- Definitions can also be restricted by another set
- There are two different notations that *mean the same thing*

```
{x ∈ S | true/false expression on x}
{x | x ∈ S and true/false expression on x}
```

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

18

## Characteristic Example

- Remember,  $Z$  is the set of integers in math
- It reads: "All  $x$  where  $x$  is in  $Z$  and  $x$  is even"

$A = \{x \mid x \in Z \wedge x \text{ is even}\}$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

19

## By Characteristic Examples

Expression	Result
$\{x \in Z \mid 0 < x < 5\}$	$\{1, 2, 3, 4\}$
$\{x \mid x \in N \wedge x < 7\}$	$\{1, 2, 3, 4, 5, 6\}$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

20

## Characteristic with Structure

- The left-hand-side (before the pipe) doesn't have to just a variable name
- It can also be any mathematical expression

$\{f(x) \mid \text{true/false expression using } x\}$

$\{y \mid y = f(x) \wedge \text{true/false using } x\}$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

21

## Let's Try One...

- The second part of the notation must always be a true/false expression
- So, how do we create a set that contains:

$\{2, 4, 6, 8, 10, \dots\}$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

22

## Let's Try One...

First approach:

$A = \{x \mid x \in N \wedge x \text{ is even}\}$

Second approach:

$A = \{2x \mid x \in N\}$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

23

## How Does It Evaluate?

- Basically, when you look at something like:  $\{2x \mid x \in N\}$ , you should do the following
- Steps:
  - Identify which variables make the right-hand-side true
  - Plug them into the left-hand-side. These are the values in the set.

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

24

## More Examples

Expression	Result
$\{2x + 1 \mid x \in \mathbb{Z}\}$	$\{\dots, -3, -1, 1, 3, 5, \dots\}$
$\{x \in \mathbb{Z} \mid \text{sqrt}(x) \in \mathbb{Z}\}$	$\{0, 1, 4, 9, 16, 25, \dots\}$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

25

## Subsets

Set Your Sets to Fun

## Subsets

- Commonly, sets are compared to one another using set relationship operators
- Basically, sets are defined on elements which they may have in common

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

27

## Subsets

- Set  $A$  is considered a subset of set  $B$  if all the members of  $A$  are also members of  $B$
- The subset operator is similar looking to the member operator

$$\{1, 4\} \subseteq \{1, 3, 4, 5\}$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

28

## Subsets

- A set  $A$  is not a subset of  $B$  if  $A$  contains an element not found in  $B$

$$\{3, 5\} \not\subseteq \{3, 7\}$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

29

## Null is Always a Subset

- A null set contains no elements
- Hence, the null set is always a subset

$$\emptyset \subseteq \{2, 3\}$$

$$\{\} \subseteq \{2, 3\}$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

30

## Proper Subsets

- Set  $A$  is a *proper subset* of  $B$  if  $A$  is a subset of  $B$ , but not equal to  $B$
- Note: the notation lacks the underline – it is consistent with other operators like  $<$  and  $\leq$

$\{ 3, 5 \} \subset \{ 3, 5, 7 \}$   
 $\{ 1, 2 \} \not\subset \{ 1, 2 \}$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

31

## Equality

- Sets  $A$  and  $B$  are considered equal if-and-only-if...

for every  $x \in A$  it is also true  $x \in B$   
 for every  $x \in B$  it is also true  $x \in A$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

32

## Equality

- So, are  $\{ 1, 2, 3 \}$  and  $\{ 2, 1, 3 \}$  equal?
- How about  $\{ 1, 1, 2, 3, 3 \}$  and  $\{ 3, 2, 1 \}$ ?
- Answer is *yes!*
  - order does not matter in a set
  - multiple occurrences does not change if an element is a member

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

33

Venn  
Diagrams

Graphically Representing Sets

## Venn Diagrams

- Sets can also be abstractly representing graphically using Venn Diagrams
- Each set is represented by circle
- Overlaps between each set can show logical relations with set members

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

35

Example:  $A = \{ 2, 7, 1, 4 \}$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

36

## Subset Venn Diagram

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

37

## Equality

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

38

## Example: Letters in English

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

39

## Operations on Sets

- New sets can be made from old sets using set operators.
- Just like new numbers can be created from old numbers:  $1 + 2 = 3$
- So, for the rest of this section, let U be the universe, and let A and B be sets

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

42

Defining Sets Using Sets

Set Operators

## Union

- A union of two sets combines all members of each set into a new one
- So, the result is two merged sets
- $A \cup B = \{x \mid x \in A \vee x \in B\}$
- The symbol  $\cup$  looks like U
  - which is also used for the "universe set"
  - be careful not to confuse the two

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

43

## $A \cup B$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

44

## Intersection

- The intersection of two sets contains only those elements that are found in both sets
- So, the result is where the two sets overlap
- $A \cap B = \{x \mid x \in A \wedge x \in B\}$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

45

## $A \cap B$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

46

## Difference

- *Difference* (aka exclusion) removes all items found in set from another
- Typically, it is written as  $A - B$  even though it is not the same as subtraction
- $A - B = \{x \mid x \in A \wedge x \notin B\}$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

47

## $A - B$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

48

## Difference – So Many Notations

- The notation for difference varies greatly
- Below are two different variations on the same notation

$$A - B$$

$$A \setminus B$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

49

## Complement

- The *complement* of a set  $A$ , is all elements in the Universe, not in  $A$
- Remember: what elements are in the Universe depends on the sets

$$A' = \{ x \mid x \notin A \}$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

50

## $A'$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

51

## Different Notations Used

- Single postfix apostrophe
- An "over bar" (which is underlining on top)
- Superscript "c" for complement

$$A' = \overline{A} = A^c$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

52

## Complement Example

- If set  $A$  is a subset of a set  $B$ , then the complement of  $A$  is all elements not in  $A$  but still in  $B$
- Look at the following:

$$A \subset B$$

$$A = \{1, 2, 3\}$$

$$B = \{1, 2, \dots, 10\}$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

53

## Complement Example

- Set  $A$  is a subset of a set  $B$
- Therefore its "universe" is defined as the set of  $B$

Therefore...

$$A' = \{4, 5, 6, 7, 8, 9, 10\}$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

54

$$(A \cup B)'$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

55

$$(A \cap B)'$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

56

## Let's Draw Some...

- Let's draw some Venn Diagrams using a several sets
- Using set operators we can highlight any area we want

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

57

## Let's Draw Some

$$U = \{a, b, c, d, e, f\}$$

$$A = \{a, b, c\}$$

$$B = \{b, c, d, e\}$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

58

## Let's Draw Some

Two sets:

In **A** but not in **B**: {a}

In **B** but not in **A**: {d, e}

In both **A** and **B**: {b, c}

In neither **A** nor **B**: {f}

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

59

## Reasoning with Venn Diagrams

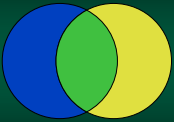

○ Say 100 people receive a questionnaire with two questions (1) Do you program Java?, (2) Do you program C#?

○ If 65 said 'yes' to Java and 40 say 'yes' to **both**. How many program just program C#?

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

60

## Set Algebra

Just a preview...

## Let's Look at These...

- Let's see if the following are the same:
- $A \cup (B \cap C)$
- $(A \cup B) \cap (A \cup C)$

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 62

## Set Algebra

- We will cover more of this later, but set algebra shares the same principles as basic math
- You can visually treat the union as a "\*" and the intersection as a "+"
- You can then factor out sets

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 63

## Another Look

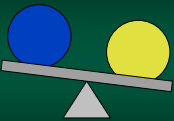

$$(A \cup B) \cap (A \cup C)$$

$$\rightarrow (A * B) + (A * C)$$

$$= A * (B + C)$$

$$A \cup (B \cap C)$$

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 64

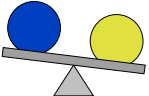

## Cardinality

Counting Sets

## Cardinality of a Set

- The *cardinality* of a set is the number of *distinct* elements
- This information is used in counting – the classification of the set's contents

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 66

## Different Notations Used

- There are two different notations used
- The most common is the  $|$  pipe delimiters
- Alternatively, the "n" function is used

$$|A| \equiv n(A)$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

67

## Examples

$$A = \{1, 3, 5, 7\}$$

$$|A| = 4$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

68

## Examples

$$B = \{1, 2, 3, 3, 3, 4\}$$

$$|B| = 4$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

69

## Counting

- If the set contains a finite number of elements, it is said to be *countable* – i.e. the cardinality is knowable
- If the set is infinitely large...
  - it is said to be *uncountable*
  - unless, the elements can be uniquely identified, then it is *countably infinite*

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

70

## Countable Examples

Set	Result
$\{x \mid x \in \mathbb{N} \text{ and } x \leq 100\}$	Countable
$\{2x \mid x \in \mathbb{N}\}$	Countably Infinite
$\{x \mid x \in \mathbb{R} \text{ and } 0 < x < 1\}$	Uncountable

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

71

Counting by Subtracting!

## Inclusion-Exclusion

- Sets can overlap – and can contain the same elements
- So, when counting items in sets, you must be careful not to count an item twice
- *Inclusion-exclusion* principle, can get the correct count

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

73

## Disjoint Set Cardinality

- If sets **A** and **B** are disjoint then they have no elements in common
- Cardinality of the union is the sum of the cardinality of both **A** and **B**

$$|A \cup B| = |A| + |B|$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

74

## Set Exclusion

- If sets **A** and **B** overlap they have elements in common
- The cardinality of the union is the sum of **A** and **B** excluding the intersection

$$|A \cup B| = |A| + |B| - |A \cap B|$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

75

## Set Exclusion

- Why?
- $|A| + |B|$  counts the intersection twice!
- So, we need to remove the duplicate count

$$|A \cup B| = |A| + |B| - |A \cap B|$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

76

## Set Exclusion

- Also note: this is the same equation for disjoint sets
- If disjoint, the intersection is  $\emptyset$

$$|A \cup B| = |A| + |B| - |A \cap B|$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

77

## Let's look at this again...

○ Say 100 people receive a questionnaire with two questions (1) Do you program Java?, (2) Do you program C#?

○ If 65 said 'yes' to Java and 40 say 'yes' to both. How many program just program C#?

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

78

## Using the Formula...

- The union of Java & C# contains 100
- Java set contains 65
- The intersection contains 40

$$|J \cup C| = |J| + |C| - |J \cap C|$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

79

## Using the Formula...

- The union of Java & C# contains 100
- Java set contains 65
- The intersection contains 40

$$100 = 65 + |C| - 40$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

80

## Using the Formula...

- The union of Java & C# contains 100
- Java set contains 65
- The intersection contains 40

$$\begin{aligned} |C| &= 100 - 65 + 40 \\ &= 75 \end{aligned}$$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

81

## Tuples

Order is Important

## Tuples & Sets

- To denote sets, we delimit the list of members with curly brackets
- For example, the prime numbers between 1 and 10 is {2, 3, 5, 7}
- Order does not matter, so {2, 3, 5, 7} = {7, 5, 3, 2}

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

83

## Tuples

- However, in many cases the *order is important*
- These are called *n-tuples* where "n" is the number of elements
- 2-tuples are also called *ordered pairs*

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

84

## Tuple Notation

- To denote a tuple – we delimit the elements by either parenthesis, angle brackets or square brackets
- Curly-brackets are never used to avoid obvious confusion

```
( 1, 2, 3 )
< 1, 2, 3 >
[ 1, 2, 3 ]
```

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

85

## Tuple Examples

- Order is important, so any element out of position will cause inequality

```
( 1, 2, 3 ) ≠ ( 3, 2, 1 )
```

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

86

## Tuple Examples

- Logic generally applies to algorithms since, in procedural programming, order is important
- The following is a tuple of events in California History

```
( Sutter's Fort Built, Bear Flag Revolt,
  Gold Rush, California Joins Union )
```

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

87

Cross  
Products

Databases use this...

## Products

- Sets can be multiplied, which will result in a set of tuples
- Well, a set of ordered pairs, to be more specific
- $A \times B = \{ (x, y) \mid x \in A \text{ and } y \in B \}$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

89

## Example Product

Given:

$A = \{1, 2\}$

$B = \{x, y\}$

$A \times B = \{ (1, x), (2, x), (1, y), (2, y) \}$

3/28/2017

Sacramento State - Cook - CSc 28 - Spring 2017

90

## Partitions

Cutting a Set Into Pieces

## Partitions

- A *partition* of a set  $A$  is a collection of non-empty disjoint sets whose union is  $A$
- So, it is like the set  $A$  was "chopped", cleanly, into subsets

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 92

## Requirements

- Each subset must be mutually exclusive
- ... unless they are identical (*because duplicates don't count in sets*)

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 93

## Partition Example

- The following is a valid partition of the set  $\{1, 2, 3, \dots, 9\}$

$\{ \{1\}, \{2, 3, 5, 7\}, \{4, 6\}, \{8, 9\} \}$

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 94

## Partition Example

- The following is a partition of  $N$ .

$N = \{ \{1\}, \{2, 3\}, \{4, 5, 6\}, \dots \}$

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 95

## Countable Examples

For the set  $\{1, 2, 3, 4\} \dots$

Set	Partition?
$\{ \{1\}, \{2\}, \{3\}, \{4\} \}$	<b>Yes</b>
$\{ \{1, 2\}, \{1, 2\}, \{3, 4\} \}$	<b>Yes.</b> $\{1, 2\}$ is duplicate
$\{ \{1, 2, 3\}, \{2, 4\} \}$	<b>No.</b>

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 96

## Power Series

All the combinations

## Power Series

- A *power set* of a set  $S$  is a set of all the subsets of  $S$
- This also, obviously, contains the null set
- The notation for the power set  $S$  is  $P(S)$

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 98

## Power Set Example

$$G = \{a, b\}$$

$$P(G) = \{ \emptyset, \{a\}, \{b\}, \{a,b\} \}$$

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 99

## Power Set Example 2

$$H = \{a, b, c\}$$

$$P(H) = \{ \emptyset, \{a\}, \{b\}, \{c\}, \{a,b\}, \{a,c\}, \{b,c\}, \{a,b,c\} \}$$

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 100

## Power Set Example 3

$$I = \{a, b, c, d\}$$

$$P(I) = \{ \emptyset, \{a\}, \{b\}, \{c\}, \{d\}, \{a,b\}, \{a,c\}, \{a,d\}, \{b,c\}, \{b,d\}, \{c,d\}, \{a,b,c\}, \{a,b,d\}, \{b,c,d\}, \{a,b,c,d\} \}$$

## Cardinality of Power Sets

- What is the cardinality of power sets?
- Is it possible to determine  $|P(S)|$  if we know  $|S|$ ?
- This will be important later...

3/28/2017 Sacramento State - Cook - CSc 28 - Spring 2017 102

## Let's Look at the Examples

$G = \{a, b\}$

$P(G) = \{ \emptyset, \{a\}, \{b\}, \{a,b\} \}$

$|G| = 2$

$|P(G)| = 4$

3/28/2017

103

## Power Set Example 2

$H = \{a, b, c\}$

$P(H) = \{ \emptyset, \{a\}, \{b\}, \{c\}, \{a,b\}, \{a,c\}, \{b,c\}, \{a,b,c\} \}$

$|H| = 3$

$|P(H)| = 8$

104

## Power Set Example 3

$I = \{a, b, c, d\}$

$P(I) = \{ \emptyset, \{a\}, \{b\}, \{c\}, \{d\}, \{a,b\}, \{a,c\}, \{a,d\}, \{b,c\}, \{b,d\}, \{c,d\}, \{a,b,c\}, \{a,b,d\}, \{b,c,d\}, \{a,b,c,d\} \}$

$|I| = 4$

$|P(I)| = 16$

## Cardinality of Power Set

- The cardinality of a power set is  $2^n$  where  $n$  is the cardinality of the original set
- This is used in statistics... covered later

$|P(S)| = 2^{|S|}$
